

Burndown Chart

We committed to a velocity of 20 points at the beginning of the sprint, while the previous sprint velocity was 22. The 20 points consisted of the remaining user stories in the product backlog, with the exception of payment authentication which was not feasible due to its inability to be tested. Moreover, our team was able to better align our burndown chart with the projected guideline because we were more familiar with the technologies and expectations for our sprint's user stories which allowed us to better manage our time.
