

Burndown Chart

We committed to a velocity of 32 points at the beginning of the sprint, while the previous sprint velocity was 20. We found that with more team organization and technology familiarity, we were able to complete more user stories (and stories with more complex tasks). At the end of Jun 30, there is a dip of story points. This is because the story has finished and a new story had been added to the sprint (worth 4 points) immediately after. There is also a drop of sprint points at the end of the sprint. Since only the user stories has been properly estimated, the burndown chart does not show when each subtask has been completed. Therefore, this does not show an accurate representation of our progress.
